4 Numerical simulations

#### Debris flows

Debris flow is composed by a mixture of solid particles mixture with fluid (water, loose mud, ...) that rush down a slope (mountainside).

**Hazard**: Some of them are very fast and produce serious damages in nearby settlements.

► A good approximation of the debris deposit and its evolution could help to mitigate related damages through risk evaluation.

Debris flow in Illgraben (Switzerland), 2016

Debris flow in Brasil, 2011

# Debris flows modelling

### Rheology

## Example for **dry granular**: $\mu(I)$ -rheology,

Jop, P., Forterre, Y., Pouliquen, O. A constitutive law for dense granular flows. Nature 441 (7094), 2006.

Granular viscosity  $\eta = \frac{\mu(I)p}{\dot{\gamma}}$  where

$$\mu(I) = \mu_s + \frac{\mu_d - \mu_s}{1 + \frac{I_0}{(D)}}; \qquad I = \frac{d_g \dot{\gamma}}{\sqrt{p/\rho_g}}$$

- I is the inertial number (depending on the flow regime) and  $\dot{\gamma}$  strain rate.
- When used with incompressible Navier-Stokes equations...
  - ▶ Well posed just for intermediate values of *I* (dense inertial regime)
  - Ill posed for very low or very high values of I (quasi-static or collisional regime)
    - T. Barker, D.G. Schaeffer, P. Bohorquez, J.M.N.T. Gray, Well-posed and ill-posed behaviour of the mu(I)-rheology for granular flow, J. Fluid Mech. 779, 2015.
  - $\blacktriangleright$  Viscosity is not defined when  $\dot{\gamma} = 0$ .

Viscosity is not defined where  $\eta = \frac{\mu(I)p}{\sqrt{\dot{\gamma}^2 + \delta^2}}$ The easiest way to solve it: regularization  $\eta = \frac{\mu(I)p}{\sqrt{\dot{\gamma}^2 + \delta^2}}$ 

#### Rheology

#### For fluidized granular

M. Trulsson, B. Andreotti, and P. Claudin. Transition from the viscous to inertial regime in dense suspensions. Phys. Rev. Lett. 109, 118305, 2012.

The inertial number depends on the flow regime:

inertial: 
$$I_i = \frac{d_g \dot{\gamma}}{\sqrt{p_g/\rho_g}};$$
 viscous:  $I_v = \frac{\eta_f \dot{\gamma}}{p_g}.$ 

The proposal:

$$\tilde{I} = I_v + \alpha I_i^2$$
 ( $\alpha$  a constant)

and

$$\mu(I) = \mu_c + \frac{\mu_F - \mu_c}{1 + \sqrt{I_0/\tilde{I}}}$$

Bottom variation

#### It is hard to tackle all items!

#### Common simplifications in mathematical models

- 3D resolution ~→ Depth-averaged models
- multi-species model ~→ One single particle sort
- proper two-phase model ~→ Mixture theory: one velocity
- complex rheology ~→ Simple or no viscous effects
- dilatancy law related to rheology → No dilatancy effects
- bottom variation ~→ Local coordinates

#### Good mathematical properties for the model to be physically relevant

- Dissipative energy balance.
- Mass and momentum conservation.

# Debris flows models

## How is it tackled in the literature?

#### **Mixture theory**

Iverson (1997) proposed a model to study shallow partially fluidized avalanches, a mixture of a granular material and a fluid.

R.M. Iverson. The physics of debris flows. Rev. Geophys., 35:245-296, 1997.

- Assumptions:
  - one velocity for the mixture (no relative motion)
  - rheology: viscosity and Coulomb friction theory
  - no dilatancy
- Ingredients:
  - stress tensors are defined as contributions from each phase
  - a pore pressure advection-diffusion equation is added based on experimental measurements

$$\partial_t h + \partial_x (hu) = 0$$

 $\rho(\partial_t(hu) + \partial_x(hu^2)) = \rho gh - h\partial_x p_{bed} - sgn(u)(\rho gh - p_{bed}) \tan \delta$  $-\nu_f \mu \dot{\gamma} - hk_{act/pass} \partial_x(\rho gh - p_{bed})$  $\partial_t p_{bed} + u\partial_x p_{bed} = D(\partial_z^2 p)_{bed}$ 

#### **Mixture theory**

they add dilatancy effects in 2014

An evolution equation for the fluid pore pressure is established using an empirical dilatancy law and a Darcy law.

Pore pressure:  $p_f = p^H + p^E$ 

$$abla \cdot v = \dot{\gamma} \tan \psi - \alpha \partial_t (\sigma - p_f)$$
  
 $(1 - \varphi)(u - v) = -\frac{\kappa}{\eta_f} \partial_x p^E$ 

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 $\circ$   $\psi :$  dilatancy angle depending on  $\varphi$ 

R. M. Iverson and D. L. George. A depth-averaged debris-flow model that includes the effects of evolving dilatancy. I. Physical basis. Proc. R. Soc. A, 470, 2014.

Based on the two-phase (solid-fluid) theory, debris flows are usually described by the conservation of mass and momentum for each phase.

T.B. Anderson, R. Jackson. A fluid mechanical description of fluidized beds. Ind. Eng. Chem. Fundam. 6, 1967.

$$\begin{array}{c} b_{n} \\ b_{l} \\ b_{l} \\ \end{array} \\ \end{array} \\ \begin{array}{c} b_{n} \\ b_{l} \\ \end{array} \\ \begin{array}{c} b_{n} \\ b_{l} \\ \end{array} \\ \end{array} \\ \begin{array}{c} b_{n} \\ b_{l} \\ \end{array} \\ \begin{array}{c} b_{n} \\ b_{l} \\ \end{array} \\ \begin{array}{c} \partial_{t}(\rho_{s}\varphi) + \nabla \cdot (\rho_{s}\varphi v) = 0 \\ \partial_{t}(\rho_{f}(1-\varphi)) + \nabla \cdot (\rho_{f}(1-\varphi)u) = 0 \\ \rho_{s}\varphi(\partial_{t}v + (v \cdot \nabla)v) = -\nabla \cdot T_{s} + (f_{0}) + \rho_{s}\varphi g \\ \rho_{f}(1-\varphi)(\partial_{t}u + (u \cdot \nabla)u) = -\nabla p_{f} - (f_{0}) + \rho_{f}(1-\varphi)g \end{array}$$

Buoyancy and drag frictional force between phases:

$$f_0 = -\varphi \nabla p_f + Fric$$

In 1D this system has 4 equations and 5 unknowns: solid volume fraction, pressures and velocities for both phases.

- Assumptions:
  - rheology: Coulomb friction theory
  - ▶ no dilatancy
  - ► two boundary conditions are imposed at the free surface:  $p_s = p_f = 0 \Rightarrow$  overdeterminated problem at the free surface
- Results:
  - no closure equation to Jackson's model
  - no energy balance

Our first contribution...

F. Bouchut, E.D. Fernández-Nieto, A. Mangeney, G. Narbona. A two-phase shallow debris flow model with energy balance. ESAIM: Mathematical Modelling and Numerical Analysis, vol. 49, 2014

- Assumptions:
  - rheology: Coulomb friction theory
  - no dilatancy
  - Closure equation for solid incompressibility:  $\nabla \cdot v = 0$
  - Only one boundary condition is imposed on the free surface:

$$(p_s + p_f)N_x = 0$$

- Results:
  - well-posed initial governing system
  - dissipative energy balance
  - An extra unknown is proposed (pf |bed), that is the Lagrange multiplier associated to the closure

#### The model:

o Mass equations

$$\partial_t(h\varphi) + \partial_x(h\varphi v) = 0$$
  
$$\partial_t(h(1-\varphi)) + \partial_x(h(1-\varphi)u) = 0$$

• Momentum equations:

$$\rho_{s}\varphi(\partial_{t}v + v\partial_{x}v) = (1 - \varphi)\partial_{x}(\underline{p_{f}})_{bed} - (1 - \varphi)\rho_{f}g\cos\theta\partial_{x}h -\varphi\rho_{s}g\partial_{x}(b + h) - \frac{1}{2}(\rho_{s} - \rho_{f})gh\cos\theta\partial_{x}\varphi -\varphi\rho_{s}g\sin\theta + \beta(u - v) - sign(v)\tan\delta\varphi(\rho_{s} - \rho_{f})g\cos\theta$$

$$\rho_f(1-\varphi)(\partial_t u + u\partial_x u) = -(1-\varphi)\partial_x(p_f)_{bed} - (1-\varphi)\rho_f g\cos\theta\partial_x b$$
$$-(1-\varphi)\rho_f g\sin\theta - \beta(u-v)$$

• Closure equation:

$$\partial_x(h(1-\varphi)(u-v))=0$$

- two-phase two-layer model: boundary conditions at the interface!

## Debris flows models

#### Boundary conditions at the interface

A kinematic condition for the solid phase,

$$\tilde{N}_t + v \cdot \tilde{N}_X = 0.$$

(where we denote by  $\tilde{N} = (\tilde{N}_t, \tilde{N}_X)$  a time-space upward normal to the interface).

A Navier fluid friction condition

$$\left(\frac{T_{fm}+T_f}{2}\tilde{N}_X\right)_{\tau}=-k_i(u_f-u_m)_{\tau}.$$

where  $k_i \ge 0$  is a friction coefficient.

• Energy balance through the interface ( $\rightsquigarrow p_s = 0$ ).

$$T_s \tilde{N}_X = \left(\frac{\rho_f}{2} \left( (u_m - u_f) \cdot \frac{\tilde{N}_X}{|\tilde{N}_X|} \right)^2 + \left( (T_{fm} \tilde{N}_X) \cdot \frac{\tilde{N}_X}{|\tilde{N}_X|^2} - p_{fm} \right) \frac{\varphi^*}{1 - \varphi^*} \right) \tilde{N}_X.$$

- コン・4回ン・4回ン・4回ン・4回ン・4日ン

#### Boundary conditions at the interface

#### Additional jump relations have to be prescribed.

Rankine-Hugoniot conditions for the exchange rate of fluid phase.

$$\tilde{N}_t + u_f \cdot \tilde{N}_X = (1 - \varphi^*)(\tilde{N}_t + u_m \cdot \tilde{N}_X) \equiv \mathcal{V}_f,$$

where:

•  $\varphi^*$  is the value of the solid volume fraction at the interface.

The term  $V_f$  defines the fluid mass that is transferred from the mixture to the fluid-only layer.

 $\circ V_f < 0$  means that the fluid is transferred from the fluid-only region to the mixture region.

Asymptotic hypothesis ( $\epsilon = H/L \ll 1$ ) The drag term is defined by

$$f = \beta(u_m - v);$$
  $\beta = (1 - \varphi)^2 \frac{\eta_f}{\kappa},$ 

where  $\eta_f$  is the dynamic viscosity of the fluid and  $\kappa$  is the hydraulic permeability

We shall consider two possible sets of assumptions.

The drag term is strong:  $\beta \sim \epsilon^{-1}$ Since the drag force  $\tilde{\beta}(u_m - v)$  has to balance gravity terms, it necessarily remains bounded. This implies that

$$u_m^x - v^x = O(\epsilon).$$

2 The drag term is moderate:  $\beta = O(1)$ In this case one has just  $u_m^x - v^x = O(1)$ . ▶ Fluid and solid pressures:

$$p_f = \rho_f g \cos \theta (b + h_m + h_f - z) + p_f^e;$$

$$p_s = \varphi(\rho_g - \rho_f) g \cos \theta (b + h_m - z) - p_f^e; \qquad p_f^e = \frac{\beta}{1 - \varphi} \int_z^{b + h_m} (u_m^z - v^z) dz$$
We have thus to evaluate  $u_m^z - v^z$  up to  $O(\epsilon^2)$  errors.

• Using the closure equation  $(\nabla \cdot v = \Phi)$ , mass equations and boundary conditions:

$$u_m^z - v^z = (u_m^x - v^x)\partial_x b - \frac{z - b}{1 - \varphi} \Big( \Phi + \nabla_{\mathbf{x}} \cdot \big( (1 - \varphi)(u_m^x - v^x) \big) \Big) + O(\epsilon^3).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

► Fluid and solid pressures:

In the model: 
$$(p_{fm}^e)_{|b}, \overline{p}_{fm}^e$$
  

$$\beta = O(\epsilon^{-1})$$

$$(p_{fm}^e)_{|b} = -\frac{\overline{\beta}}{(1-\varphi)^2} \frac{h_m^2}{2} \Phi + O(\epsilon^2), \quad \overline{p}_{fm}^e = -\frac{\overline{\beta}}{(1-\varphi)^2} \frac{h_m^2}{3} \Phi + O(\epsilon^2).$$

$$\beta = O(1)$$

$$(p_{fm}^e)_{|b} = \frac{\overline{\beta}}{1-\varphi} \left( h_m(u_m^x - v^x)\partial_x b - \frac{h_m^2}{2(1-\varphi)} \left( \Phi + \partial_x \left( (1-\varphi)(u_m^x - v^x) \right) \right) \right) + O(\epsilon^3),$$

$$\overline{p}_{fm}^e = \frac{\overline{\beta}}{1-\varphi} \left( \frac{h_m}{2} (u_m^x - v^x) \partial_x b - \frac{h_m^2}{3(1-\varphi)} \left( \Phi + \partial_x \left( (1-\varphi)(u_m^x - v^x) \right) \right) \right) + O(\epsilon^3).$$

#### The model:

o Mass equations

$$\begin{aligned} \partial_t(h_m\varphi) + \partial_x(h_m\varphi\nu) &= 0\\ \partial_t(h_m(1-\varphi)) + \partial_x(h_m(1-\varphi)u) &= -\mathcal{V}_f\\ \partial_t(h_f) + \partial_x(h_fu_f) &= \mathcal{V}_f \end{aligned}$$

• Momentum equations:

$$\rho_{s}\varphi(\partial_{t}v + v\partial_{x}v) = (1 - \varphi)\partial_{x}(p_{fm})_{bed} - \varphi g\cos\theta(\rho_{s}\partial_{x}(b + h_{m}) + \rho_{f}\partial_{x}h_{f}) -\frac{1}{2}(\rho_{s} - \rho_{f})gh\cos\theta\partial_{x}\varphi -\varphi\rho_{s}g\sin\theta + \beta(u - v) - sign(v)\tan\delta_{eff}\frac{1}{h_{m}}(\varphi(\rho_{s} - \rho_{f})g\cos\theta h_{m} - (p_{fm})_{bed}) +$$

$$\rho_f(1-\varphi)(\partial_t u + u\partial_x u) = -(1-\varphi)\partial_x (\underline{p_{fm}})_{bed} - (1-\varphi)\rho_f g \cos\theta \partial_x (b+h_m+h_f) -(1-\varphi)\rho_f g \sin\theta - \beta(u-v) - \frac{1}{h_m} \left( (\frac{1}{2}\rho_f \mathcal{V}_f - k_i)(u_f - u) + k_b u \right)$$

 $\rho_f(\partial_t u_f + u \partial_x u) = -\rho_f g \cos \theta \partial_x (b + h_m + h_f) - \rho_f g \sin \theta - \frac{1}{h_f} \left( (\frac{1}{2} \rho_f \mathcal{V}_f + k_i)(u_f - u) \right)$ 

• Closure equation:

$$\partial_t \varphi + v \partial_x \varphi = -\varphi \Phi$$

# Debris flows models

$$\begin{array}{ll} \text{if } \varphi < \varphi_{eq} \text{: compression} & \quad \text{if } \varphi > \varphi_{eq} \text{: dilation} \\ \nabla \cdot v < 0 & \quad \nabla \cdot v > 0 \end{array}$$

 $\overline{a}$ 

$$\blacktriangleright \bar{p}_{fm} = \rho_f g \cos \theta (b + h_m + h_f) + \bar{p}_{fm}^e; \qquad p_{fm}^e = -\frac{\bar{\beta}}{(1 - \varphi)^2} \frac{h_m^2}{3} K \dot{\gamma} (\varphi - \varphi_{eq})$$

► Transference fluide:

$$\mathcal{V}_f = -h_m \Phi - \partial_x ((1-\varphi)h_m(u-v))$$

▶ Impact of the dilatancy angle on the Coulomb friction force:

$$T_{s}^{sz} = -\tan(\underbrace{\delta + \psi}_{\delta_{eff}})\operatorname{sign}(v) \underbrace{p_{s|bed}}_{p_{s|bed}}$$
$$\underbrace{p_{s|bed}} = \varphi(\rho_{s} - \rho_{f})gh_{m}\cos\theta - (p_{f}^{e})_{bed}; \qquad (p_{f}^{e})_{bed} = -\frac{\beta}{(1 - \varphi)^{2}}\frac{h_{m}^{2}}{2}\Phi$$

- We perform the tests of the collapse of a granular column in a viscous liquid that is experimentally investigated in
  - L. Rondon, O. Pouliquen and P. Aussillous, *Granular collapse in a fluid: Role of the initial volume fraction*, Physics of Fluids, **23**, 073301, 2011
- This experiment corresponds to a one-dimensional dam-break with an initial rectangular mixture mass of height  $H_i$  and width  $L_i$  that is at rest with a volume fraction  $\varphi_i$ .
- The experiment exhibits results for a loose and a dense initial packing configurations characterized by the data ( $\varphi_i = 0.55, L_i = 6 \text{ cm}, H_i = 4.8 \text{ cm}$ ) and ( $\varphi_i = 0.6, L_i = 6 \text{ cm}, H_i = 4.2 \text{ cm}$ ) respectively.
- $\rho_s = 2500 \text{ kg m}^{-3} d = 225 \,\mu\text{m}, \, \rho_f = 1000 \text{ kg m}^{-3} \text{ and } \eta = 12 \times 10^{-3} \text{ Pa.s.}$
